This read has been verified (found to hit its original self in the correct orientation), as part of the I.M.A.G.E. Consortium quality control effort. High quality sequence is defined as having 100 or more base pairs with a phred quality value of 20 or greater, where a sliding window of 4 base pairs with a phred quality value of 15 or greater marks the beginning and end of the sequence. For information on obtaining this clone, please contact info@image.llnl.gov.

Another Corgan: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCL_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726468-728711, and 729096-731399, Subtraction by Bento

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                         ó
                                                The present invention describes peptides which bind to human leukocyte antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into tumour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLS) in pathological conditions such as cancer and in HLA-Typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present

The invention relates to 1046 novel nucleic acids which are used as markers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when they are shown not to express one of the 242 sensitivity markers or the cells are shown not to express one of the 804 resistance markers. The methods can be used to determine the effectiveness of TAXOL.

The methods can be used to determine the effectiveness of TAXOL.

The methods can be used to determine the effectiveness of TAXOL.

The methods can be used to determine the effectiveness of TAXOL.

The methods can be used to determine the effectiveness of TAXOL.

The methods can be used to determine the effectiveness of TAXOL.

The methods can be used to determine the markers can also be used as targets in developing treatments for cancer, particularly those cancers which alsolate cancer agents developed by the novel method can be used to treat cancer. Probes based on the markers can be used to detect transcripts or genomic sequences corresponding to the markers, in the identification of cells or tissues which mis-express the protein. Cancers which may be targeted include carcinoma (e.g. squamous cell carcinoma), imphonma, plasmocytoma, reticulum cell sarcona, Hodgkin's disease and turnors (e.g. gliona), the present sequence is one of the 1046
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the effectiveness of

The present invention describes peptides which bind to human leukocyte antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into tumour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLS) in pathological conditions such as cancer and in HLA-Typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present
                                                                                                                                                                                                                                                                                                                                                                                           418

antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into tumour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLs) in pathological conditions such as cancer and in HLA-typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes a GAGE-6 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In Contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally if antigen of GAGE-3 cDNA for the first 112 bases. This region of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by capterssion of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ij

```
The present sequence encodes a GAGE-5 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV1817-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE connex for the first 112 bases. This region of GAGE-3 cona contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by

                                          transplants
expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants

contrast the only normal tissue which expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPS have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequences not the rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE cDNAs for the first 112 bases. This region of GAGE-3 DNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic 7 cell clone proliferation methodologies. Other uses for the processed peptides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   179

The present sequence encodes a GAGE-4 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the CAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE cDNAs for the first 112 bases. This region of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.

                                                                                       The present invention describes peptides which bind to human leukocyte antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into Lumnour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLs) in pathological conditions such as cancer and in HLA-typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present

contrast the only normal tissue which expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is nested to only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE CDNAs for the first 112 bases. This region of GAGE-3 contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to proliferation methodologies. Other uses for the processed peptides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   228

The invention relates to a method for diagnosing cancer, tumour progression, hyperproliferative cell growth or accompanying biological and physical manifestations. The method involves contacting the biological sample with a probe that comprises a sequence capable of hybridising to any of the 339 nucleotide sequences given in the products and methods of the invention can be used for the diagnosis, prognosis, and treatment of cancer, tumour progression, hyperproliferative cell growth, and accompanying physical and biological manifestations. They can be used particularly for prostatic disorders such as metastatic prostate cancer, localised prostate cancer, or benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ď

This sequence represents a prostate cancer specific nucleic acid sequence. The invention relates to a method for diagnosing cancer, tumour progression, hyperproliferative cell growth or accompanying biological and physical manifestations. The method involves contacting the biological sample with a probe that comprises a sequence capable of

hybridising to any of the 339 nucleotide sequences given in the specification (see AA297140-297478) and detecting duplex formation. The products and methods of the invention can be used for the diagnosis, prognosis, and treatment of cancer, tumour progression, hyperproliferative cell growth, and accompanying physical and biological manifestations. They can be used particularly for prostatic disorders such as metastatic prostate cancer, localised prostate cancer, or benign prostate hyperplasia (BPH).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is GAGE tumour rejection antigen (TRA) precursor (TRAP) gene, derived from the human melanoma cell line MZ2-MEL (see PCT/US92/O4154). It encodes peptides that are processed into human MHC HLA-A29 mol. binding peptides, i.e. TRA. The TRA peptides can be used in the diagnosis of pathological conditions, e.g. cancer, and for carrying out HLA-typing assays, e.g. for skin grafts or organ transplants.

                                                                                                                                                                                                                                                                          The present invention describes peptides which bind to human leukocyte antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into tumour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLS) in pathological conditions such as cancer and in HLA-Typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLS in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                     RiAzen, E.A.; Kim, H.S.; Goodman, P.; Flynn, S.; Maeda, N.
Am. J. Hum. Genet. 41, 1035-1047, 1987
A.Title: Alleles at the PRH1 locus coding for the human salivary-acidic proline-rich paracession: A27307; MUID:88074309
A; Reference number: A27307; MUID:88074309
A; Accession: A27307
A; Status: nucleic acid sequence not shown
A; Molecule type: DNA
A; Residues: 1-171 < AZE>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       glutenin high molecular weight chain Ax2 precursor - wheat

BIOL. 6:1965-1973(1986).

-I- ALTERNATIVE PRODUCTS: DROSOPHILA TROPOMYOSIN 1 GENE CAN PRODUCE FOUND LIFEREBRY I SOPROMS BY ALTERNATIVE PRODUCTS: A MUSCLE FORM, AND TWO FUSION PROPEINS (33 AND 34).

-I- DOMAIN: THE MOLECULE IS IN A COILED COIL STRUCTURE. THE SEQUENCE EXHIBITS A PROMINENT SEVEN-RESIDUES PERIODICITY.

-I- SIMILARITY: BELOAGGS TO THE TROPOMYOSIN FAMILY.

-I- CAUTION: REF. 2 SEQUENCE DIFFERS FROM THAT SHOWN MAINLY BECAUSE OF ALTERNATIVE EXON USAGE.

Biol. 15:197-201(1990).

-!- FUNCTION: SEED STORAGE PROTEIN. ACCUMULATES DURING SEED
DEVELOPMENT AND IS HYDROLYZED AFFER SERAITION TO PROVIDE A
CARBON AND NITROGEN SOURCE FOR THE DEVELOPING SEEDLING.
-!- SUBUNIT: THE ALPHA'-, ALPHA-, AND BETA-SUBUNITS ASSOCIATE IN
VARIOUS COMBINATIONS TO FORM TRIMERIC PROTEINS.
-!- SUBCELLULAR LOCATION: EMBRYO AXIS, AND COTYLEDONARY MEMBRANE-BOUND
VACUOLAR PROTEIN BODIES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ÷
                                                                                                                                                                                                                                 reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide Which induces a cytotoxic T imphocyte response when bound to a major histocompatibility complex (MHC) class I molecule or the isolated PAGE-4 protein can be used in immunogenic compositions to raise a cytotoxic T lymphocyte response prostate, uterus and testis. The nucleic acids encoding PAGE-4 or PAGE-4 peptide fragments can also be used in these compositions.

Antibodies against PAGE-4 and its peptide fragments can be used in detecting the presence of PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are not related to reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. The received in therapeutic applications, the received in the page of the presence of PAGE-4 can also be used to raise antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. The received in therapeutic applications, the received in the page of the received the received in the page of the presence of page and page of the received in the page of the page
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence represents a GAGB-2 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21).

The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE cDNAs for the first 112 bases. This region of GAGE-3 cond is a maintain structure. The antigens can be used to diagnose malenomms, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into Dlood or urine can be observed and then used to confirm a diagnosis of melanomm using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PAGE-4; MAGE; GAGE; reproduction; testis; prostate; fallopian tube; uterus; placenta; cancer; major histocompatibility complex; MHC; CTL; cytotoxic T lymphocyte; immunce response; antibody; drug delivery;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ï
                                                                                                                        reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

In solated PAGE-4 peptide which induces a cytotoxic T in ymphocyte response when bound to a major histocompatibility complex (MHC) class I molecule or the isolated PAGE-4 protein can be used in immunogenic compositions to raise a cytotoxic T lymphocyte response prostate, uterus and testis. The nucleic acids encoding PAGE-4 or PAGE-4 peptide fragments can also be used in these compositions.

Antibodies against PAGE-4 and its peptide fragments can be used in checting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are the nucleonal and the spread of cancerous reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of raise antibodies which are then used as the targeting group of raise antibodies which are then used as the targeting group of raise antibodies which are then used as the targeting group of raise antibodies which are then used as the targeting group of raise antibodies which are then used as the targeting group of raise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PAGE-4; MAGE; GAGE; reproduction; testis; prostate; fallopian tube; uterus; placenta; cancer; major histocompatibility complex; MHC; CTL; cytotoxic T lymphocyte; immunce response; antibody; drug delivery;
                                                                                                                                                                                                                                                                                                                                                                                    immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. The PAGE polypeptide shares sequence similarity with the GAGE and MAGE family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

PAGE-4 is a gene preferentially expressed in normal male and female reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms. An isolated PAGE-4 peptide which induces a cytotoxic T lymphocyte response when bound to a major histocompatibility complex (MHC) class I molecule or the isolated PAGE-4 protein can be used in immunosenic compositions to raise a cytotoxic T lymphocyte response against cells expressing PAGE-4 including cancer cells of the prostate, uterus and testis. The nucleic acids encoding PAGE-4 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PAGE-4 peptide fragments can also be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in detecting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are not related to reproduction can be indicative of the spread of cancerous reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. The PAGE family polypeptide shares sequence similarity with the GAGE and MAGE family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MSWRGRST-YRPRPRRYVEPPEMIGPMRPEQFSDEVEPATPEEGEPATQRQDPAAAQEGE 59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a GAGE-4 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21).

The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1. TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5 end is totally cifferent from the other GAGE cDNAs for the first 112 bases. This region of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. The antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1;

PAGE-4 is a gene preferentially expressed in normal male and female reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and placenta, ratio pattern makes it a target for uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide which induces a cytotoxic T proposyte response when bound to a major histocompatibility complex (MHC) class I molecule or the isolated PAGE-4 protein can be used in immunogenic compositions to raise a cytotoxic T lymphocyte response prostate, uterus and testis. The nucleic acids encoding PAGE-4 or PROSTATE, and the presence of PAGE-4 and inthese compositions.

Antibodies against PAGE-4 and its peptide fragments can be used in detecting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are not related to reproduction can be indicative of the spread of cancerous reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of immunocularity and intention and in the presence of page-4 can also be used to raise immunocularity and prompted in the presence of page-4 can also be used to raise immunocularity and the presence of page-4 can also be used to raise immunocularity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PAGE-4; MAGE; GAGE; reproduction; testis; prostate; fallopian tube; uterus; placenta; cancer; major histocompatibility complex; MHC; CTL; cytotoxic T lymphocyte; immunce response; antibody; drug delivery;

This has applications for drug delivery systems. The PAGE polypeptide shares sequence similarity with the GAGE and MAGE family of proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   XEXTXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                           PAGE-4 is a gene preferentially expressed in normal male and female reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide which induces a cytotoxic T pumphocyte response when bound to a major histocompatibility complex. WHC) class I molecule or the isolated PAGE-4 protein can be used in immunogenic compositions to raise a cytotoxic T lymphocyte response gapinst cells expressing PAGE-4 including cancer cells of the prostate, uterus and testis. The nucleic acids encoding PAGE-4 or PAGE-4 peptide fragments can also be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in detecting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are not related to reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. The PAGE antily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

The present sequence represents a GAGE-5 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5 end is totally different from the other GAGE CDNAS for the first 112 bases. This region of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic 7 cell clone. Confirm adiagnosis of melanoma using cytolytic 7 cell clone. Proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MSWRGRSTYR-PRPRRYVEPPEMIGPMRPEQFSDEVEPATPEEGEPATQRQDPAAAQEGE 59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a GAGE-6 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expressed GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379.to 521 of the GAGE-1 can position, with the exception of GAGE-3 whose 5 end is totally different from the other GAGE CDNAs for the first 112 bases. This capion of GAGE-3 cDNA contains a long repeat and a halpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The present sequence represents a GAGE-1 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 of TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE CDNAS for the first 112 bases. This credion of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. SKin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
PAGE-4 is a gene preferentially expressed in normal male and female reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide which induces a cytocoxic T jumphocyte response when bound to a major histocompatibility complex (MHC) class I molecule or the isolated PAGE-4 protein can be used in immonogenic compositions to raise a cytocoxic T jumphocyte response against cells expressing PAGE-4 including cancer cells of the prostate, uterus and testis. The nucleic acids encoding PAGE-4 or PAGE-4 peptide fragments can also be used in these compositions.

Antibodies against PAGE-4 and its peptide fragments can be used in detecting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are concertual tespecial can be indicative of the spread of cancerous reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. The PAGE and MAGE family concerned to reproductive tissues used in therapeutic applications.
                                                                                                                                                                                                                                                              PAGE-4; MAGE; GAGE; reproduction; testis; prostate; fallopian tube; uterus; placenta; cancer; major histocompatibility complex; MHC; CTL; cytotoxic T lymphocyte; immunce response; antibody; drug delivery;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated PAGE-4 protein and peptide used for inducing a cytotoxic T lymphocyte response and for raising antibodies which can be used to detect the presence of PAGE-4 in cell samples or body tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä

```
The present sequence represents a GAGE-3 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testia. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various osition, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE CDNAs for the first 112 bases. This region of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melalomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic cell clone. Confirm a diagnosis of melanoma using cytolytic real clone. Proteistation methodologies. Other uses for the processed peptides, include HIA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs derived from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22 MIGPMRPEQFSDEVEPATPEEGEPATQRQDPAAAQEGEDEGASAGQGPKPEAHSQEQGHP 81

                                             The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymerased are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving applement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) are useful for treating classories involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed setting, with was obtained in electronic format directly from WIPO application, which was obtained in electronic format directly from WIPO application.
